

Paediatric Respiratory Pathogen Report

Week 23, 07th June 2021 – 13th June 2021

*****Please note, an abridged version of this report will be circulated whilst influenza activity is low*****

- There were 7 paediatric cases of RSV this week. Two were from the Metro area and five were from regional WA.
- There were no paediatric influenza cases detected at PathWest this week.
- The most common respiratory virus in paediatric patients this week was parainfluenza virus 1 (16 cases).
- The total number of paediatric cases of COVID-19 detected by PCR at PathWest is 56, as of 13th of June.

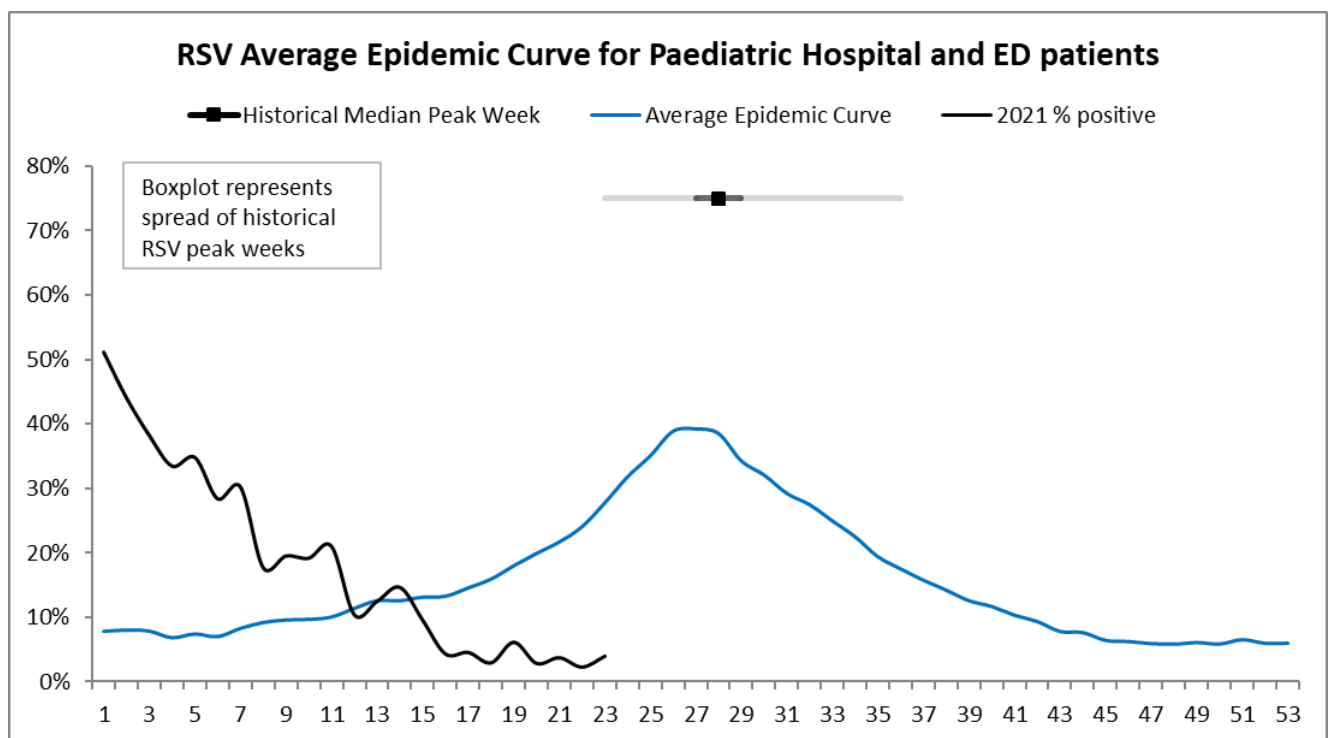

Figure 1: The current season plotted against the Paediatric RSV Average Epidemic Curve. The average epidemic curve was constructed by averaging all seasons measured at PathWest QE2 from 2007-2019. The high intensity threshold is 1.645 standard deviations above (upper 90% CI) the average epidemic curve. Data represents all WA hospitalised and ED paediatric patients tested by PathWest.

RSV proportion positive (4%) is lower than levels historically observed at this time of year.

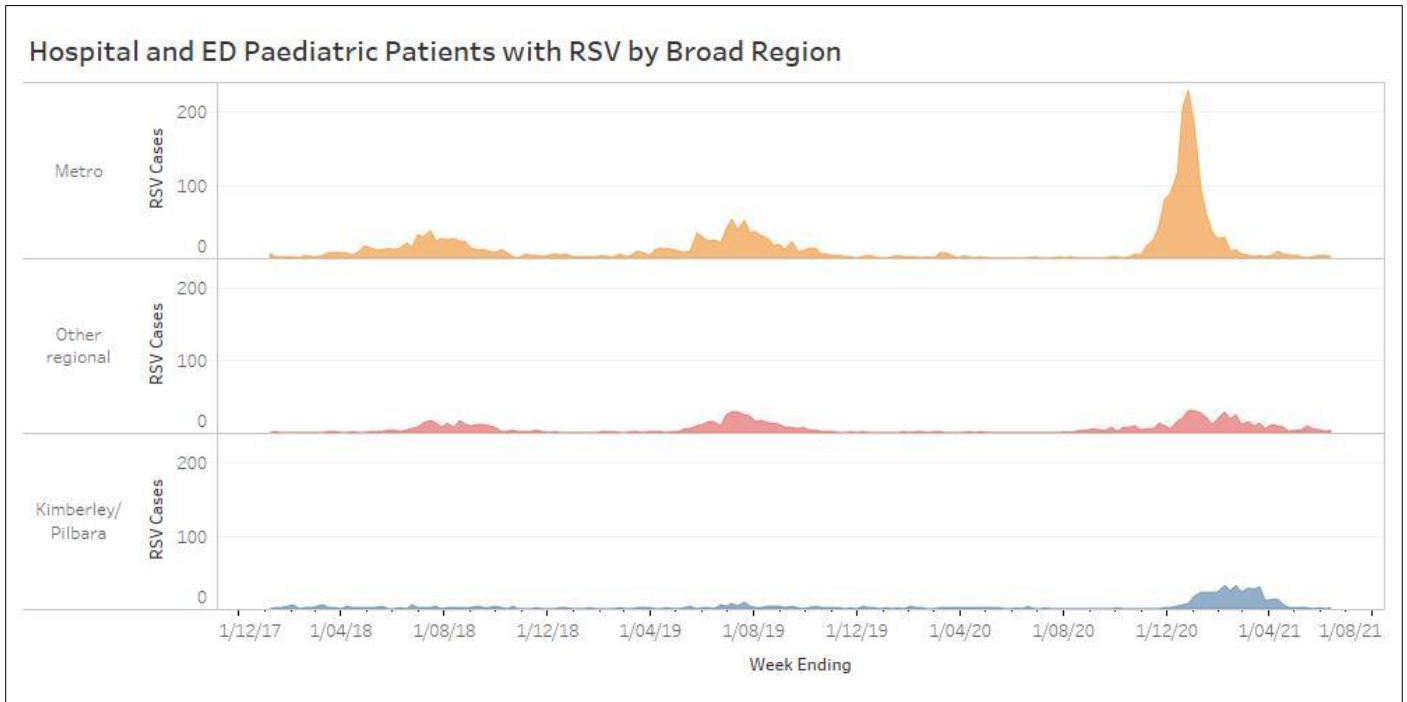

Figure 2: Hospital attending paediatric patients with RSV in Perth metropolitan region, in both Kimberley and Pilbara combined and in the remaining regions combined.

Of the 7 paediatric cases of RSV this week, two were from the Metro area, three from the Goldfields, Southwest and Pilbara each had one case.

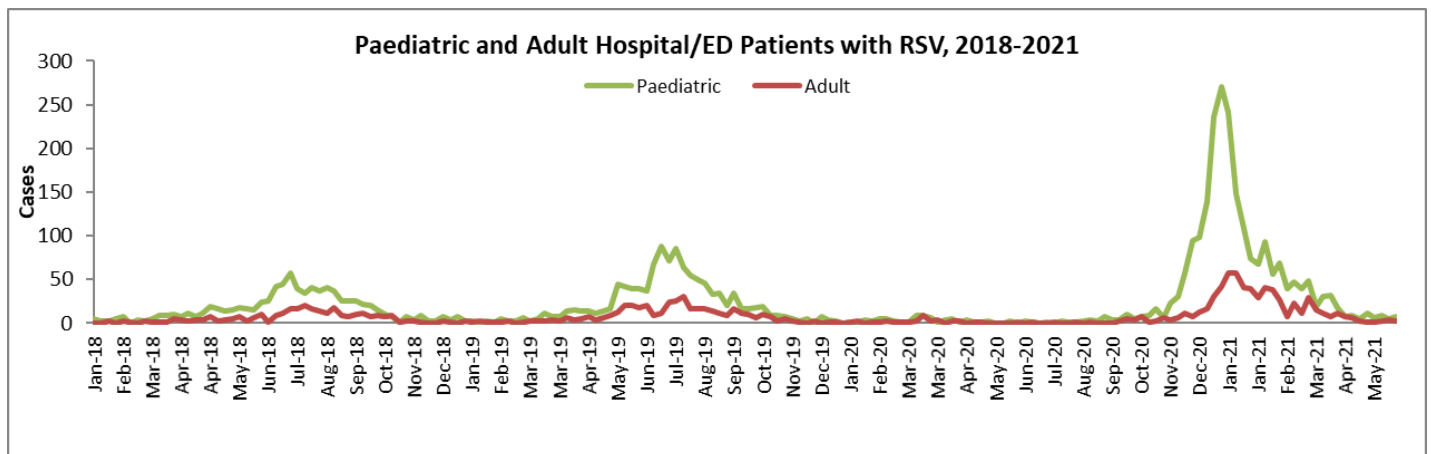

Figure 3: Paediatric and adult hospital attending patients with RSV, 2018-2021.

There were 7 children and 2 adults with RSV who attended a hospital.

Data is representative of all patients attending a hospital (public or private) in Western Australia, for which a respiratory sample was collected and tested at a PathWest laboratory.
