

Virus Watch

Week ending 4th July 2021

Key Points

Please note that the influenza and ILI surveillance systems in Western Australia (WA) have been impacted by the COVID-19 pandemic. Therefore, respiratory viral activity should be interpreted with caution and take into account the effects of changes in health seeking behaviour including accessing alternate health services such as telehealth, focused testing for COVID-19 at COVID-19 clinics or specific acute respiratory infection clinics and the impact of physical distancing measures.

Influenza and influenza-like illnesses (ILI)

- Indicators of influenza activity remain below interseasonal levels.
- ILI presentations at Emergency Departments (EDs) increased in the past week and ILI activity at sentinel General Practices (GPs) were in the mid-range of values usually seen at this time of year.
- There were no PCR positive influenza samples reported by PathWest in the past week.
- Non-influenza virus detections increased the past week, influenced by increased testing. Parainfluenza 1-3 detections remained higher than values usually seen at this time of year.

Gastroenteritis

- Gastroenteritis presentations at sentinel GPs were in the upper-range of values usually reported at this time of year. Presentations and admissions at EDs were below baseline levels.
- PathWest laboratory detections of norovirus and rotavirus remained low.

Other vaccine-preventable diseases

- **Shingles and chickenpox:** Shingles and chickenpox presentations at EDs were above baseline levels in the past week.
- **Measles:** No measles cases were notified in the past week.
- **Mumps:** No mumps case were notified in the past week.
- **Rubella:** No rubella cases were notified in the past week.
- **Invasive meningococcal disease (IMD):** No IMD cases were notified in the past week.

Other diseases

- **Coronavirus COVID-19:** As of 4th July 2021, a total of 1,033 confirmed COVID-19 cases have been notified in WA. See [webpage](#) for further information.

Virus Watch is a weekly electronic publication by the Communicable Disease Control Directorate (CDCD) and key collaborators. It provides a brief summary of General Practice and Hospital Emergency Department sentinel surveillance data on influenza-like illness, gastroenteritis and varicella-zoster disease, together with relevant laboratory information, to alert health care workers in WA to important circulating viruses. All figures and data were accurate at time of publication, but subject to change. The data collections used to create this publication include:

- Sentinel General Practice (GP) data collected by WA members of the Australian Sentinel Practices Research Network (ASPREN)
- Emergency Department (ED) data provided by the Emergency Department Information System (EDIS), which currently incorporates data from the following hospitals: Fiona Stanley Hospital, Sir Charles Gardiner Hospital, Royal Perth Hospital, Perth Children's Hospital, King Edward Memorial Hospital, St John of God Midland, Bunbury Hospital, Armadale Hospital, Joondalup Health Campus, and Rockingham General Hospital.
- Notification data derived from disease notifications (Western Australian Notifiable Infectious Diseases Database [WANIDD]) received by CDCD, WA Department of Health from medical providers and public or private laboratories in WA. These data are updated routinely to include admission status for all public and public/private hospitals in WA and hospitalisation data are included in the report during the influenza season.
- Viral laboratory data obtained from PathWest laboratories at QEII Medical Centre, as well as via notification data sent by all WA laboratories to CDCD, WA Department of Health. As of 1 August 2020, daily reporting of COVID-19 cases include only confirmed cases diagnosed by nose and throat swabs. See [webpage](#) for further information

Influenza and influenza-like illnesses (ILI)

The rate of ILI presentations to sentinel GPs decreased in the past week and were in the mid-range of values usually reported at this time of year (Figure 1). All 12 samples submitted for influenza testing by sentinel GPs so far this year have been negative.

Figure 1. Rate of ILI per 1000 consultations at sentinel GPs (Australian Sentinel Practices Research Network) in WA by week, 2017 to 2021

Rates of ILI presentations and ILI admissions to ED increased in the past week (Figure 2).

Figure 2. Number and rate of ILI presentations/admissions to Emergency Departments in WA in the last eight weeks

*This graph is a summary of current EDIS data using the ICD codes B34.9 and J06.9, which are consistent with a clinical presentation of a viral illness. This data may differ from that presented in the Winter Respiratory Illness Report provided by the Information and System Performance Directorate.

The number of respiratory viral presentations to EDs increased in the past week and remained in the mid-range of values usually reported at this time of year (Figure 3).

Figure 3. Number of respiratory viral presentations to Emergency Departments in WA by week, 2017 to 2021

*This graph is a summary of current EDIS data using the ICD codes B34.9 and J06.9 which are consistent with a clinical presentation of a viral illness. This data may differ from that presented in the Winter Respiratory Illness Report provided by the Information and System Performance Directorate.

There were no influenza notifications reported to the Department of Health in the past week (Figure 4).

Figure 4. Number of influenza notifications in WA by week, 2017 to 2021

*The graph is a summary of all influenza notifications, by week of onset, received by the DoH, Western Australia (through Western Australian Notifiable Infectious Diseases Database [WANIDD]) to the end of the current reporting week. The seasonal threshold defines a value above which may indicate epidemic seasonal influenza activity. The threshold value is calculated based on analysis of seasonal influenza data from the past four years.

None of the 1,194 specimens submitted for influenza PCR testing at PathWest were positive in the past week (Figure 5). The last PCR positive influenza sample reported by PathWest was in July 2020.

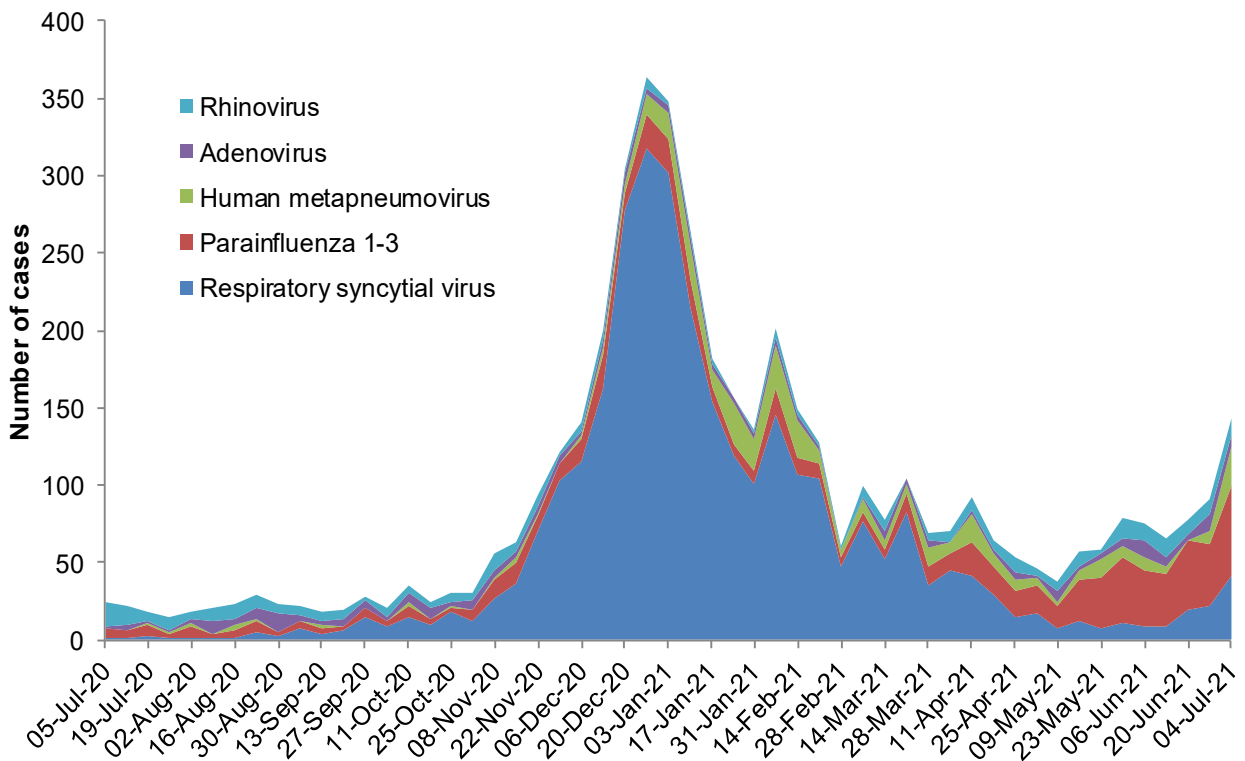

Figure 5. Proportion of influenza PCR specimens positive for influenza at PathWest by week, 2017 to 2021

*The graph is a summary of all WA samples reported by PathWest, excluding samples referred by other private laboratories for influenza subtyping.

Non-influenza virus detections increased the past week, influenced by increased testing. Parainfluenza 1-3 detections are higher than the range of values usually reported at this time of year (Figure 6).

Figure 6. Number of non-influenza respiratory virus detections at PathWest by week, 2020 to 2021

*The graph is a summary of all WA samples positive for a common respiratory virus other than influenza reported at PathWest.

COVID-19 activity remained low in Western Australia. The majority of cases have been acquired overseas or at sea (Figure 7).

Figure 7. Number of confirmed COVID-19 cases in WA by optimal date of onset and place of acquisition, 2020 to 2021

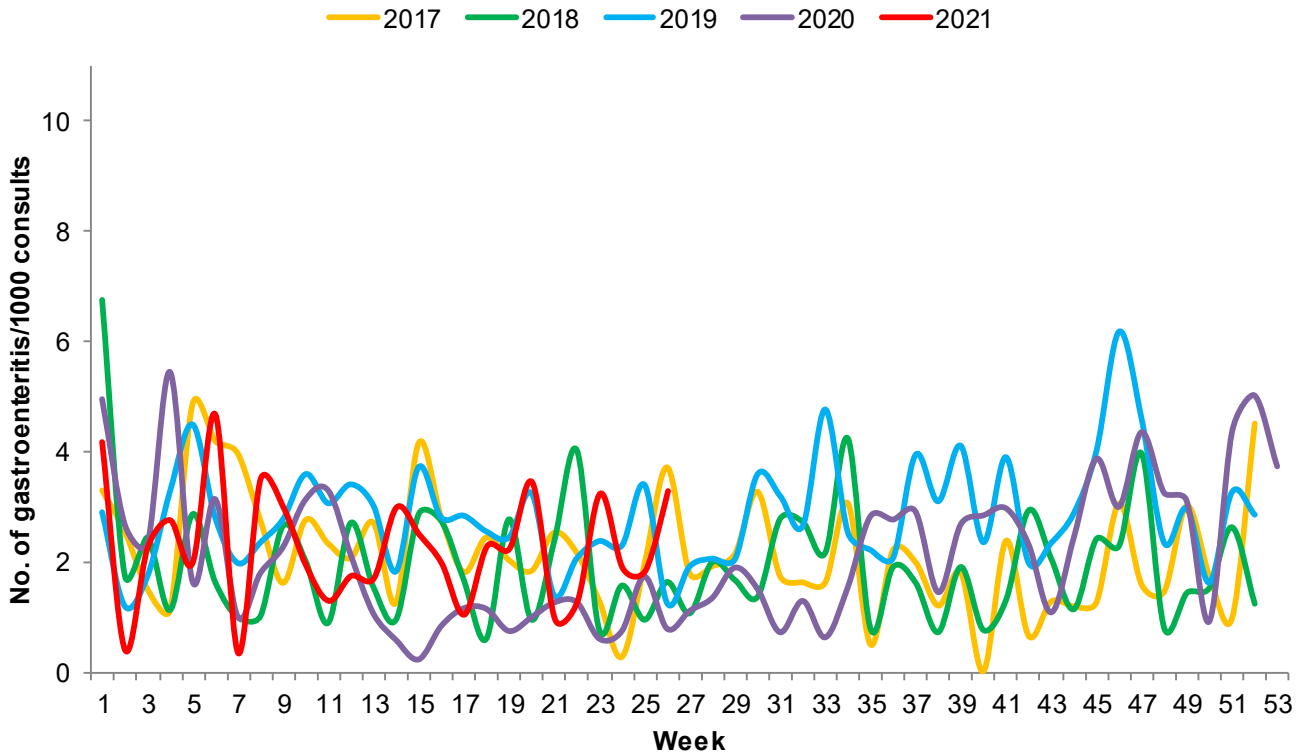

*Includes all specimens that tested positive for SARS-CoV-2 virus by polymerase chain reaction (PCR) tests at Western Australian pathology laboratories.

Gastroenteritis

The number of gastroenteritis presentations to sentinel GPs were in the upper-range of values usually reported at this time of year (Figure 8).

Figure 8. Number of gastroenteritis presentations per 1000 consultations at sentinel GPs (Australian Sentinel Practices Research Network) in WA by week, 2017 to 2021

Gastroenteritis presentations and admissions to EDs in the past week remained below baseline levels (Figure 9).

Figure 9. Number of gastroenteritis presentations and admissions to Emergency Departments in WA in the last eight weeks

*This graph is a summary of current EDIS data for gastroenteritis presentations and admissions. Baseline levels for gastroenteritis presentations and admissions were calculated using the mean of weekly EDIS data from week 1, 2016 to week 52, 2020.

The number of gastroenteritis presentations at EDs remained well below the range of values usually reported at this time of year (Figure 10).

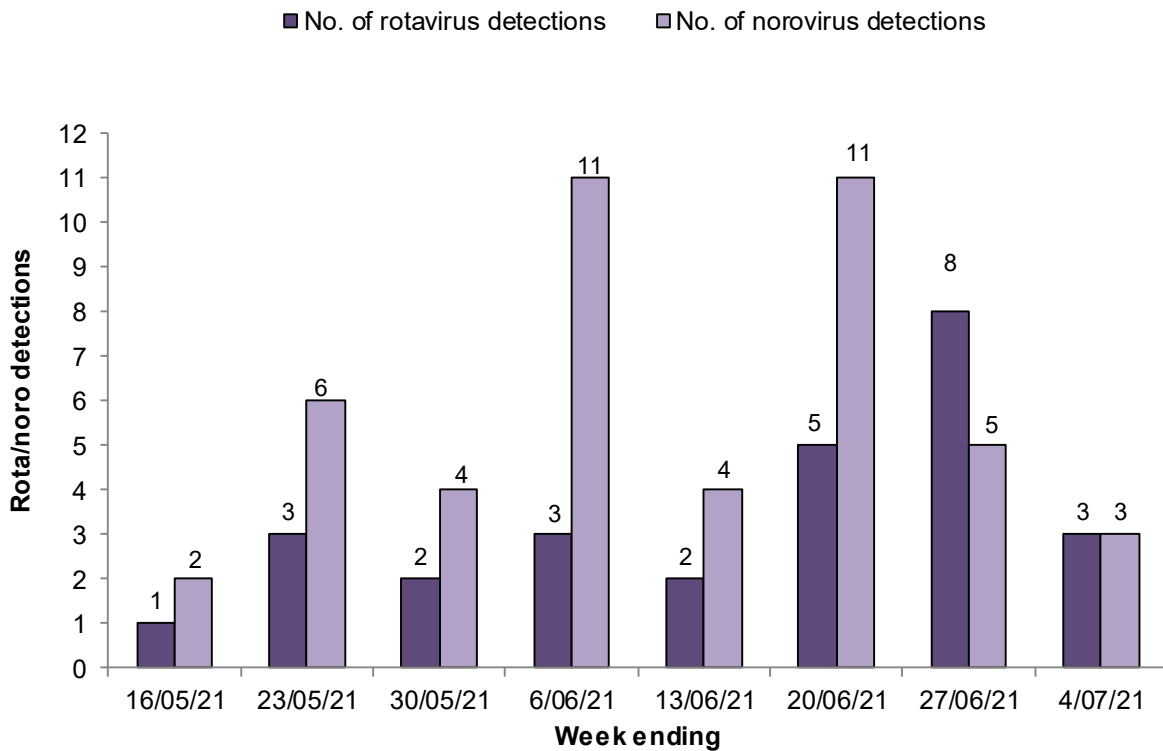

Figure 10. Number of gastroenteritis presentations to Emergency Departments in WA by week, 2017 to 2021

*This graph is a summary of current EDIS data for gastroenteritis presentations

The number of norovirus and rotavirus detections at PathWest decreased in the past week (Figure 11).

Figure 11. Number of norovirus and rotavirus detections at PathWest in WA in the last eight weeks

Viral rashes

Chickenpox and shingles presentations at sentinel GPs were below baseline levels in the past week (Figure 12).

Figure 12. Number of varicella-zoster presentations per 1000 consultations at sentinel GPs (Australian Sentinel Practices Research Network) in WA in the last eight weeks

*Baseline levels for chickenpox and shingles presentations to WA ASPREN GPs per thousand consultations were calculated using the mean of weekly WA ASPREN data from week 1, 2016 to week 52, 2020.

Chickenpox and shingles presentations at EDs were above baseline levels in the past week (Figure 13).

Figure 13. Number of varicella-zoster presentations to Emergency Departments in WA in the last eight weeks

*Baseline levels for varicella-zoster virus presentations were calculated using the mean of weekly EDIS data from week 1, 2016 to week 52, 2020.
