

Data reflected in this summary of mosquito-borne disease in the Great Southern Region is taken from the Western Australia Notifiable Infectious Disease Database (WANIDD) and includes enhanced surveillance data collected by Population Health Units and Local Governments. (Only locations with notified cases of disease are shown in tables and figures).

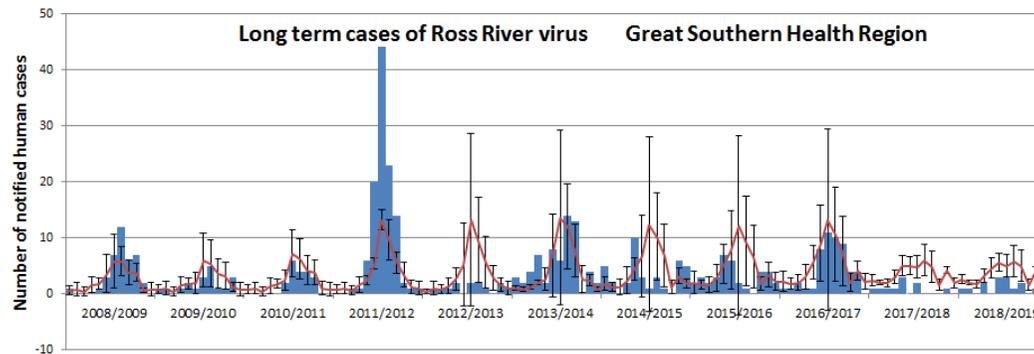

Ross River virus (RRV)

There were two RRV cases reported by lab during this quarter. One of these was also notified by doctor. No follow up data are available. There was a total of 15 RRV cases reported during 2018/19 which is significantly below the long term monthly mean for all months.

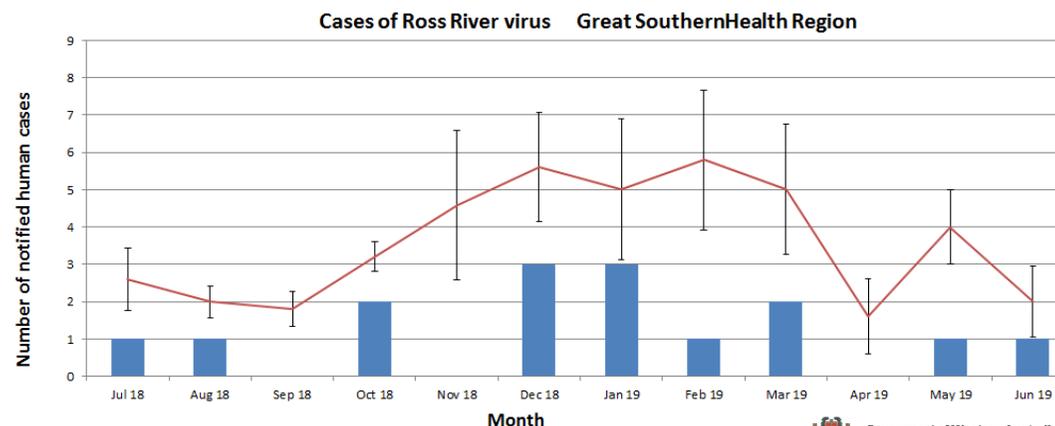

RRV 2019	Apr	May	Jun	Total
Great Southern		1	1	2
Albany (C)		1		1
MCKAIL		1		1
Denmark (S)			1	1
DENMARK			1	1
Total		1	1	2

Barmah Forest virus (BFV)

There were no BFV cases reported in this quarter. The only case notified during 2018/19 was confirmed with follow up data from Kalgan in September 2018. The long term monthly mean is less than one BFV case per month.

Fiscal Year
■ Notified human cases — Long Term Mean

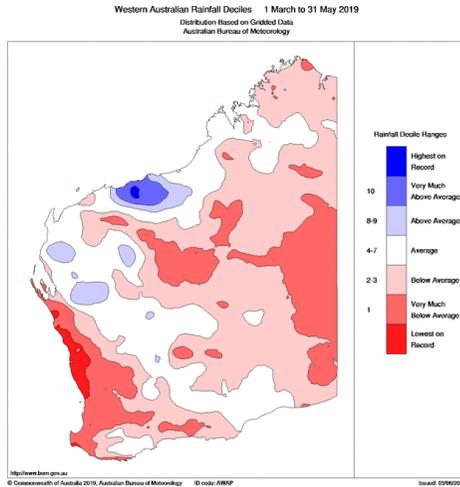

Month
■ Notified human cases — Monthly 5yr moving average

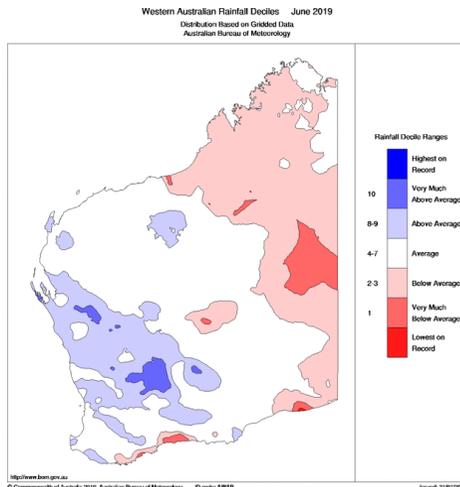

Data reflected in this summary of mosquito-borne disease in the East Metro Region is taken from the Western Australia Notifiable Infectious Disease Database (WANIDD) and includes enhanced surveillance data collected by Population Health Units and Local Governments. (Only locations with notified cases of disease are shown in tables and figures).

Relative Rainfall Mar – May (Autumn) 2019

Relative Rainfall June 2019

Serologically confirmed doctor-notified and laboratory reported cases of Ross River virus disease each month in WA, July 2018 - June 2019

El Niño conditions are associated with a decrease in rainfall and tidal activity.

La Niña brings wetter and warmer than normal weather which can increase mosquito breeding and mosquito borne diseases.

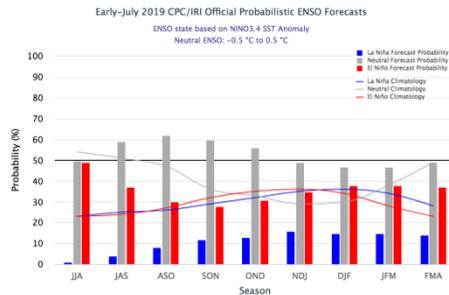

Positive Indian Ocean Dipole brings below average winter–spring rainfall, above average temperatures.

Australian Bureau of Meteorology (BOM) ENSO issued 9 July 2019

The **El Niño–Southern Oscillation (ENSO)** is currently **neutral** - neither El Niño nor La Niña. While the possibility of El Niño can't be completely ruled out for 2019, the tropical Pacific Ocean is expected to remain in an ENSO-neutral phase over the coming months meaning the **ENSO Outlook remains at INACTIVE**. Model outlooks indicate a **positive Indian Ocean Dipole is likely to be the dominant climate driver for Australia's weather for much of the rest of 2019**, meaning an increased likelihood of a drier than average winter–spring.

International Research Institute for Climate and society IRI ENSO Forecast issued 11 July 2019

The official CPC/IRI outlook, still with an **El Niño advisory**, calls for a 60% chance of ENSO-neutral by Jul-Sep, and neutral remains the most likely category through northern hemisphere fall and winter.

Australian BOM Climate Outlook issued 11 July 2019

A drier than average August to October is likely for large parts of the country, including the northern half of Australia, southwest WA. The month of August is likely to be drier for the far southwest of WA.

Warmer August to October days likely nationwide. Chances are very high (greater than 80%) for the northern half of the country and inland southern WA.

Nights are also likely to be warmer than average for much of Australia. Historical accuracy for August to October maximum temperatures is moderate to high for most of Australia, except for parts of the Pilbara in WA. Minimum temperature accuracy is moderate for most of Australia but patchy across the southeast quarter and western WA.
